Activity-1 Decode The Chart

Chart-1:

It shows the sales comparison between Delhi, Hyderabad, Indore and Surat, with Indore having the highest sales and Delhi the lowest. I do not fully trust this chart because the y-axis starts at around 540 instead of 0, which makes the differences between the bars look much larger than they actually are.

Chart-2:

It shows how survey responses are divided among different options. I do not fully trust this chart because it has too many pie slices, making it difficult to compare the categories accurately. A bar chart would be easier to understand.

Chart-3: It shows that organic food sales and autism diagnoses appear to increase together over time. I do not fully trust this chart because it uses two different y-axes, which can make unrelated data look correlated. The chart does not prove that one causes the other.

Chart-4: It shows the relationship between advertising spending and sales revenue using many data points. I do not fully trust it completely because the points overlap heavily and form dense areas, making the actual pattern difficult to see. Using transparency or a different type of chart would make it clearer.
